

Satpuda Core

Complete GitHub + Release + Auto-Update Guide
(Push code → Build EXEs → Publish release → Test update)

CONFIDENTIAL — For Developer Use Only

Follow the sections **in order**. Each new version repeats Sections 3–7.

Step	What you do
1	Push project to GitHub (first time only)
2	Bump version in core/app_version.py
3	Build SatpudaCore.exe + SatpudaCore_Win7.exe
4	Push latest code to GitHub (git push)
5	Create GitHub Release — attach BOTH EXEs
6	Test Settings → Updates in the app

OK: EXEs are uploaded to GitHub **Releases**, not stored in git. dist*.exe is in .gitignore.

1. Prerequisites (One-Time Setup)

- 1 Install **Git for Windows**: <https://git-scm.com/download/win>
- 2 Install **Python 3.13** (for Win10/11 EXE) and **Python 3.8** (for Win7 EXE — optional but recommended).
- 3 Have a **GitHub account** logged in on your browser.
- 4 Open **Command Prompt** or **PowerShell** as your user (not admin required).

Verify Git works

```
git --version
```

You should see something like: git version 2.x.x

WARNING: Never commit secrets: `oauth_client.json`, `service_account.json`, `backup_creds.dat`, `activation.dat`, `veterinary.db`. They should stay local or in `.gitignore`.

2. Push Project to GitHub (First Time Only)

If the repo already exists on GitHub and your PC is linked, skip to Section 3.

2A — Create empty repo on GitHub (browser)

- 1 Open <https://github.com/new>
- 2 Repository name: **satpuda-core-pc-offline-medical-management**
- 3 Visibility: **Public** (simplest for store auto-update; no token needed).
- 4 Do **NOT** add README, .gitignore, or license (you already have code).
- 5 Click **Create repository**.

2B — Open project folder in terminal

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"
```

2C — Initialise git and push (copy-paste block)

Replace the commit message if you like. Run line by line or as a block:

```
git init
git branch -M main
git remote add origin
https://github.com/roshanghogale/satpuda-core-pc-offline-medical-management.git
git add .
git status
git commit -m "Initial commit: Satpuda Core medical management app"
git push -u origin main
```

NOTE: If **git remote add origin** says remote already exists, use:

```
git remote set-url origin
https://github.com/roshanghogale/satpuda-core-pc-offline-medical-management.git
```

2D — If GitHub asks for login

Use **GitHub Personal Access Token** as the password (not your GitHub password).

- 1 GitHub → Settings → Developer settings → Personal access tokens → Generate new token (classic).
- 2 Scopes: check **repo**.
- 3 Copy token; paste when git asks for password.

2E — Repo already exists (your case)

Your remote is already set. To push current work for the first time with this guide:

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"
git status
git add .
```

```
git commit -m "Add GitHub auto-update and release guide"  
git push origin main
```

OK: After push, open <https://github.com/roshanghogale/satpuda-core-pc-offline-medical-management> — your code should appear.

3. Bump Version (Every New Release)

Example: releasing v1.0.1

- 1 Open **core/app_version.py**
- 2 Change: `APP_VERSION = "1.0.1"`
- 3 Save the file.

NOTE: GitHub release tag must be **v1.0.1** (letter v + same number as APP_VERSION).

WARNING: Build the EXE **after** bumping APP_VERSION so the EXE reports the correct version.

4. Build Both EXE Versions

From the project folder:

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"  
build_exe.bat
```

Wait 5–10 minutes. At the end you should see:

Output file	Path	Target PCs
SatpudaCore.exe	dist\SatpudaCore.exe	Windows 8 / 10 / 11
SatpudaCore_Win7.exe	dist\SatpudaCore_Win7.exe	Windows 7 / 8 / 8.1

Verify files exist (PowerShell)

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"  
dir dist\SatpudaCore.exe  
dir dist\SatpudaCore_Win7.exe
```

WARNING: If SatpudaCore_Win7.exe is missing, install Python 3.8 and run build_exe.bat again. You can still publish Win10/11-only, but Win7 stores cannot auto-update.

Quick local test (recommended)

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"  
python main.py
```

Or run dist\SatpudaCore.exe from a test folder with veterinary.db.

5. Push Code to GitHub (Every Release)

Push source code **before** creating the GitHub Release. EXE files stay local — you upload them manually in Section 6.

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"
git status
git add core/app_version.py core/github_updater.py
git add ui/settings/settings_tabs/updates_tab.py ui/settings/settings.py main.py
git add generate_github_release_guide_pdf.py VeterinaryApp.spec VeterinaryApp_Win7.spec
git add .
git commit -m "Release v1.0.1: auto-update and purchase import fixes"
git push origin main
```

NOTE: Change the commit message and version in the message to match your release. **git add .** stages all changed files; review with **git status** first.

WARNING: Do not force-push (git push --force) unless you know what you are doing.

OK: Code on GitHub and EXE in dist\ are separate: stores download EXE from Releases, not from git.

6. Create GitHub Release (Attach EXEs)

Browser steps — this is what makes auto-update work.

```
https://github.com/roshanghogale/satpuda-core-pc-offline-medical-management/releases
```

- 1 Click **Draft a new release**.
- 2 Tag: type **v1.0.1** → **Create new tag: v1.0.1 on publish**.
- 3 Release title: **Satpuda Core v1.0.1**.
- 4 Write release notes (shown in app when user checks for updates).
- 5 Under **Attach binaries**, add BOTH files from dist\:

```
dist\SatpudaCore.exe  
dist\SatpudaCore_Win7.exe
```

- 1 Uncheck **Set as a pre-release** (unless testing).
- 2 Click **Publish release**.

Asset name (exact)	Downloaded by
SatpudaCore.exe	PCs running SatpudaCore.exe (Win 10/11)
SatpudaCore_Win7.exe	PCs running SatpudaCore_Win7.exe (Win 7)

WARNING: File names must match exactly. Do not rename to SatpudaCore_v1.0.1.exe.

7. Test the Update Feature in the App

7A — Test on an OLD EXE (simulates a store PC)

You need an EXE built with an **older** APP_VERSION (e.g. 1.0.0) while GitHub has v1.0.1.

- 1 Option A: Keep a copy of the previous dist\SatpudaCore.exe before rebuilding.
- 2 Option B: Temporarily set APP_VERSION = "1.0.0", build, test, then restore 1.0.1.
- 3 Run the old EXE (not python main.py — auto-install only works from built EXE).
- 4 Go to **Settings** → **Updates**.
- 5 Click **Check for Updates** — should show v1.0.1 available.
- 6 Click **Download & Install** — confirm, app restarts with new EXE.
- 7 Verify version line shows v1.0.1 and (Windows 10 / 11 — SatpudaCore.exe).

7B — Test from python main.py (dev mode)

Check for Updates works, but Install opens the browser instead of replacing files.

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"  
python main.py
```

7C — What success looks like

OK: Check for Updates finds the release; CGST/SGST and data unchanged after install; activation not requested again on same PC.

7D — First release ever

If GitHub has no releases yet, the app shows: *No GitHub releases published yet*. Complete Section 6 first, then test again.

8. Full Command Cheat Sheet (Copy-Paste)

First-time: push project to GitHub

```
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"
git init
git branch -M main
git remote add origin
https://github.com/roshanghogale/satpuda-core-pc-offline-medical-management.git
git add .
git commit -m "Initial commit: Satpuda Core"
git push -u origin main
```

Every new version (e.g. v1.0.1)

```
# 1) Edit core/app_version.py → APP_VERSION = "1.0.1"
cd /d "C:\Users\rosha\Downloads\mac2 (2)\mac2\mac2"
build_exe.bat
git add .
git commit -m "Release v1.0.1"
git push origin main
# 2) Browser: create release v1.0.1, attach dist\SatpudaCore.exe + dist\SatpudaCore_Win7.exe
# 3) Test: old EXE → Settings → Updates → Download & Install
```

9. Publishing Checklist

Step	Done?
Git installed and repo on GitHub	■
APP_VERSION bumped in core/app_version.py	■
build_exe.bat completed	■
dist\SatpudaCore.exe exists	■
dist\SatpudaCore_Win7.exe exists	■
git commit + git push origin main	■
GitHub Release tag vX.Y.Z created	■
Both EXEs attached to release	■
Tested Check for Updates on Win10/11 EXE	■
Tested on Win7 EXE (if used)	■

10. Troubleshooting

Problem	Fix
git push rejected	Run git pull origin main first, resolve conflicts, push again.
Authentication failed	Use GitHub Personal Access Token as password.
No releases published yet	Complete Section 6 — Publish release with EXEs.
Update found, no download	Attach the matching EXE name to the release.

Win7 gets wrong EXE	Asset must be named SatpudaCore_Win7.exe exactly.
Store cannot reach GitHub	Allow api.github.com and github.com on network.

Regenerate: `python generate_github_release_guide_pdf.py`
